

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

ARITHMETIC.

Conducted by B. F. FINKEL, Kidder, Mo. All contributions to this department should be sent to him.

SOLUTIONS TO PROBLEMS.

29. Proposed by B. H. YOUNG, West Sunbury, Pennsylvania.

An interest bearing note dated August 1st, 1892, was discounted at 90 days at 8%. The face of the note was \$750, and the proceeds \$759.982. What was the date of discount?

Solution by Professor G. B. M. ZERR, Principal of High School, Staunton, Virginia, and P. S. BERG, Apple Creek, Ohio.

90 days + 3 days grace = 93 days.

Interest on \$1.00 for 93 days at 8% = \$.0206 $\frac{1}{3}$.

\$1.00 - \$.0206 $\frac{1}{3}$ = \$.9793 $\frac{1}{3}$ = proceedr of \$1.00

\$759.982 \div .9793 $\frac{1}{3}$ = \$776.0197, the amount of the note at the end of the 90 days.

\$776.0197 - \$750. = \$26.0197, interest.

Interest on \$750 for 1 year at 6% = \$45.00.

\$26.0197 \div \$45 = 6 months 27 days.

6 months, 28 days - 90 days = 3 months, 28 days.

August 1, 1892 + 3 months 28 days = November 29, 1892.

\therefore The note was discounted November 29, 1892.

30. Proposed by F. P. MATZ, M. Sc., Ph. D., Professor of Mathematics and Astronomy in New Windsor College, New Windsor, Maryland.

While dressing a fifty-cent chicken, a poulterer found a fifty-dollar diamond in the chicken's gizzard. He sold the chicken at a profit of 25cts., changed with good money the counterfeit ten-dollar bill handed him by the unknown purchaser, and realized 50% of the estimated value of the diamond. What per cent. of gain, or loss, did the poulterer make? Suppos the purchaser of the chicken and of the diamond had been one person, what per cent. of gain, or loss, would he have made after selling the diamond for \$25 in good money?

I Solution by the PROPOSER.

The poulterer paid 50 cents for the chicken and gave away \$9.25 in change. His total loss is, therefore, \$9.75. His total gain, the amount realized on the diamond, is \$25.00. Hence the poulterer's net gain is \$15.25, which is 152 $\frac{1}{2}$ % of the capital invested by him. The unknown purchaser, investing \$25, had after his transactions were made, a chicken the market-value of which was 75 cents, and also \$9.25 in good money as change. On his diamond-transaction, he neither gained nor lost. Therefore, the unknown purchaser's total gain is \$10., which is 40% of the capital by him invested during his transactions.

Different interpretations of the conditions of the problem, may lead to different results.
